See attached instructions.

https://gemini.google.com/app/3dda8712114b759e

User prompt: See attached instructions.

Response: **Methodological Note on Page Access:** Web access in this environment operates via Google Search index retrieval rather than a direct headless browser fetch. Where exact clauses, documentation parameters, and effective dates were read directly from indexed page excerpts, they are quoted and cited below. Where a full PDF or complete legal page body could not be opened end-to-end beyond its indexed excerpts (such as the full body of `Exa_Labs_Terms_of_Service.pdf`, `[you.com/terms](https://you.com/terms)`, `kagi.com` API Terms, `jina.ai/legal`, `mojeek.com` API terms, and `newsapi.ai/terms`), the affected cells are marked **Unclear (page not fully readable)** rather than assumed to pass.

SERP Resellers and Dropped / Retired Candidates

- **SerpAPI, Serper, ScrapingDog, Bright Data SERP API, String, APIserpent: Fail by construction** — Google's Terms of Service (*"You may not send automated queries of any sort to Google's system without express permission in advance from Google"*, alongside Google's SearchGuard anti-bot measures and December 2025 DMCA litigation against SerpApi) and Microsoft's Services Agreement (*"you may not: i. circumvent or bypass any technological protection measures… vi. use the Services in any unauthorized way"*) prohibit unauthorized automated scraping of their SERPs.
- **Microsoft Bing Search APIs: Dropped (Retired)** — Microsoft decommissioned all Bing Search APIs (Web, News, Custom Search, etc.) on August 11, 2025; its replacement, *Grounding with Bing Search* in Azure AI Agents ($14/1k transactions, classic agents retiring March 31, 2027), fails Requirement 3 because developers *"don't have access to raw content returned from Grounding with Bing Search"* and its terms prohibit storing output or using it to evaluate AI models.
- **Associated Press (AP) & Reuters Developer APIs: Dropped (Enterprise/B2B only)** — Neither offers self-serve individual signup or public pay-as-you-go pricing; AP's public website terms restrict access to *"personal non-commercial use only"* without a negotiated commercial Media API license, and Reuters Connect / LSEG Refinitiv Data Platform requires enterprise contract licensing.

Candidate Survey Table

Candidate	1. Official API & AI/LLM Input	2. Indefinite Storage / Caching	3. Page Content & Length Limits	4. Publicatio
Tavily	**Pass.** Built for "AI Tools" (LLMs/agents); Help Center explicitly permits sending output to third-party or local LLMs for inference (bars training competing models on AI answers).	**Pass.** Explicitly allows indefinite storage of metadata, snippets, and full-page content with no maximum cache TTL or post-termination deletion requirement.	**Pass.** `/search` returns `content` chunks (1–3 chunks, ~500–800 chars each) + `include_raw_content` (`markdown` or `text`, full parsed page) at no extra credit cost; `/extract` batches up to 20 URLs.	**Pass.** Returns filters via `sta` (`YYYY-MM-DD` `filter_by_p` `true` (strictly of-window pa
Parallel (`parallel.ai`)	**Pass.** Designed for AI agents; Customer Terms grant license to use Parallel APIs and define returned data as `"Customer Output"` / `"Customer IP"`. Bars automated high-risk decisions without human oversight.	**Pass (by Customer IP structure; no retention cap).** Customer Outputs are defined as `"Customer IP"`; no clause in Customer Terms forbids storing or caching Customer Outputs indefinitely.	**Pass.** `/v1/search` returns `excerpts` (configurable via `max_chars_per_result` & `max_chars_total`, CLI default 60,000 chars); `/v1/extract` returns `excerpts` or `full_content` Markdown (e.g., 50,000 chars/result).	**Partial / Pass** `publish_dat` Structured so `after_date` upper-bound `before:YYY`
Perplexity Search API	**Pass.** `/search` is explicitly built for agent tool loops; Search Addendum governs `/search` (distinct from Sonar LLM APIs).	**Unclear (page not fully readable).** Search Addendum §2.2 ("Data Use") could not be read in full from search snippets; Schedule 1 states Customer does not own `/search` Output.	**Pass.** `POST /search` returns extracted page text in `snippet`, sized via `max_tokens_per_page` and `max_tokens`.	**Pass.** Returns `last_update` `search_afte` `search_befo` (`%m/%d/%Y`) p `last_update`

Candidate	1. Official API & AI/LLM Input	2. Indefinite Storage / Caching	3. Page Content & Length Limits	4. Publicatio
Exa (`exa.ai`)	**Pass.** Built for LLM grounding; API docs explicitly support feeding `/search` and `/contents` into AI agents.	**Unclear (PDF not fully readable).** Only portions of `Exa_Labs_Terms_of_Service.pdf` surfaced in snippets; could not verify absence of a caching/storage limit in the PDF.	**Pass.** `/search` includes `contents.text` (full extracted text, configurable via `maxCharacters`) and `contents.highlights` at no extra cost for top 10 results.	**Pass.** Suppor `startPublis` `endPublishe` `contents.s` at 100 reques contact).
You.com API	**Pass.** Web Search (`ydc-index.io/v1/search`) and Contents API explicitly target AI agents and RAG.	**Unclear (ToS not fully readable).** Docs recommend a 5–15 min gateway cache TTL (`max_age`), but full API storage terms in `[you.com/terms](https://you.com/terms)` could not be verified verbatim.	**Pass.** `POST /v1/search` with `extraction_mode: "highlights"` (up to 50 results) or `"full_page"` (`markdown` or `html`, up to 100 results).	**Pass.** Returns `freshness` s range `YYYY-M`
Firecrawl (`/v2/search`)	**Pass.** ToS §1 states *"Firecrawl is an API that converts any website into LLM-friendly data."*	**Unclear (ToS not fully readable).** Full text of `firecrawl.dev/terms-of-service` on long-term output retention could not be read in full; Third-Party Data providers carry separate terms.	**Pass.** `/v2/search` returns Search Highlights by default; full-page Markdown scraping can be enabled per result.	**Partial / Uncl** style `tbs` time `qdr:w`, etc.); s publication tir all sources is Tavily/Exa.
Brave Search API	**Pass (on Data for AI plans).** "Data for Search" forbids AI inference, while "Data for AI" (Free AI / Base AI / Pro AI) explicitly permits LLM inference and includes `/res/v1/llm/context`.	**Fail (on self-serve tiers).** ToS §2.b.i states: *"Licensee shall not at any time… store the results of the API or any derivative works from the results"*. Indefinite storage requires an enterprise "Data with Storage Rights" contract.	**Pass.** `/res/v1/llm/context` returns pre-extracted text chunks, tables, and code blocks (~2,064 tokens/call avg) for LLM grounding.	**Pass.** Suppor bounded `YYY` ranges (`date_` `date_before`
Linkup (`linkup.so`)	**Pass.** Built for AI agents; ToS explicitly includes `"AI agents"` in the definition of `"Authorized Users"`.	**Fail / High Risk.** ToS Article 4.1 restricts Open Web Content use to the EU Directive 2019/790 Art. 3/4 TDM exception and requires Client to *"retain Open Web Content for as long as is necessary for the purposes of text and data mining only"*.	**Pass.** `/search` and `/fetch` return extracted snippets and full-page Markdown.	**Unclear.** Blog date filtering, bound parame readable in sr
DeepSeek Search & Fetch API *(Added)*	**Pass.** `POST /v1/tools/search` and `/v1/tools/fetch` are built specifically for AI agent loops.	**Unclear (ToS not read).** DeepSeek's API Terms of Service were not retrieved in full to verify storage/caching permissions.	**Pass.** Search supports `need_content: true` to return extracted page text in `content`; Fetch converts any URL to Markdown.	**Pass.** Returns `after:YYYY-` `before:YYY` string (128-ch
Kagi Search API	**Pass.** Commercial `/api/v1` Search and Extract APIs return LLM-ready Markdown and offer an official MCP server.	**Unclear (API Terms not fully readable).** `[kagi.com/privacy](https://kagi.com/privacy)` was read, which links to a separate Kagi API Terms of Service whose full text was not in search snippets.	**Pass.** Search API includes `"Extra snippets: full, clean page content alongside your results"`; Extract API returns clean Markdown for up to 10 URLs/call.	**Unclear.** Scop exist, but stric date filtering v snippets.

Candidate	1. Official API & AI/LLM Input	2. Indefinite Storage / Caching	3. Page Content & Length Limits	4. Publicatio
Jina (`s.jina.ai` / `r.jina.ai`)	**Pass.** Explicitly marketed as *"your preferred grounding solution for your LLMs"*.	**Unclear (ToS not fully readable).** `jina.ai/legal/` (May 4, 2026) snippets only showed GDPR clauses, not API output retention rules. Also unclear whether `s.jina.ai` scrapes third-party SERPs under the hood.	**Pass.** `s.jina.ai` searches the web and converts top results directly into full LLM-friendly Markdown text.	**Fail / Unclea** prefix reader/ documented s publication filt dated leakage
Mojeek Search API	**Pass.** PAYG plans explicitly include `"AI Usage"` and blog confirms freedom to combine results with LLMs.	**Pass.** Standard PAYG plans on `[mojeek.com/services/search/web-search-api/]` (`https://mojeek.com/services/search/web-search-api/`) explicitly include `"Storage Rights"`.	**Fail.** Returns snippets only, up to a maximum of **511 characters** (`"request snippets of considerable length; up to 511 characters"`); no full-page extraction endpoint.	**Unclear.** Date documented i
Google Custom Search JSON API	**Fail (Closing).** Closed to new customers on January 20, 2026 (returns HTTP 403 to new projects); shuts down completely on January 1, 2027. Google's Gemini Grounding replacement returns synthesized answers rather than raw results and forbids caching/analyzing results.	**Fail.** Standard Custom Search / Grounding terms prohibit caching or storing results.	**Fail.** Returns 10 short snippets per call only; no full-page content endpoint.	**Pass.** Suppor `sort=date:r`
NewsAPI.org	**Unclear.** Terms do not explicitly address LLM inference; prohibits building a competing news database.	**Pass (with caveats).** Use License grants permission *"to download the materials (information or software) on News API's website for as long as your use case requires"*, though you may not *"reproduce or republish copyrighted material"*.	**Fail.** Pricing FAQ explicitly states: *"Is the full article content available with any plan? No, unfortunately we cannot provide the full content with our search results. However, you are able to use the URL included with each result to scrape this yourself"* (violating Req 3).	**Pass.** Returns filters via `fro`
Event Registry / NewsAPI.ai	**Pass.** Provides an official MCP server (`mcp.newsapi.ai`) for AI assistants and entity/article extraction.	**Unclear (ToS not fully readable).** Full text of `newsapi.ai/terms` on indefinite local storage was not visible in snippets.	**Pass.** Returns full article bodies, disambiguated entities, and sentiment metadata.	**Pass.** Filters b (last 30 days archive back t tokens/search
GNews (`gnews.io`)	**Pass.** Marketing page explicitly lists *"AI agents, RAG pipelines, and research projects"* as supported use cases.	**Fail / Unclear.** ToS (`gnews.io/legal/terms-of-service`, Oct 18, 2026) states: *"Reasonable caching of API responses for application performance is permitted"*, which does not grant indefinite archival storage rights under the project's strict rule.	**Pass (on paid plans).** Paid plans return full article text in `content` (Free plan truncates to 250 chars).	**Pass.** Returns and filters via parameters ba

Ranked Recommendation

1. **#1 — Tavily (`tavily.com`): The only candidate with explicit, published written permission for every single requirement.**
    - **Why it wins:** Because the project's rule is that *"silence is not permission"*, Tavily stands alone due to its dedicated Help Center policy pages (updated November 2–4, 2026) interpreting its Platform Terms of Service (updated May 4, 2026). Tavily explicitly confirms in writing that: (a) you may send output to third-party or local LLMs for inference; (b) you may store metadata, snippets, **and full-page `raw_content` or complete API responses indefinitely** with no maximum cache period and no obligation to delete stored output when your subscription ends; and (c) you may publish derived outputs, citations, and short quotations without even a mandatory Tavily attribution requirement (subject to underlying publisher copyright/fair use). Technically, `/search` with `include_raw_content="markdown"`, `end_date="YYYY-MM-DD"`, and `filter_by_published_date=True` solves both the full-text requirement (at zero extra credit cost beyond 1 credit per basic search) and the strict temporal-leakage requirement (dropping undated pages and pages published after the agent's session). At 18,000 queries/month, it costs ~$124–$136/month at 1,000 RPM.
    - **Caveat to check:** Section 3.2 of the Platform ToS uses standard B2B boilerplate (*"solely for Customer's internal business purposes"*), although Tavily's documentation explicitly provisions personal accounts (*"or per user for personal accounts"*) and a *"Researcher (free)"* tier.
2. **#2 — Parallel (`parallel.ai`): Best cost-to-quality runner-up with clean IP framing, at ~1/10th the price of Tavily.**
    - **Why it ranks second:** Parallel's Customer Terms (effective October 17, 2026) define API responses as `"Customer Output"` and classify both Customer Inputs and Customer Outputs as `"Customer IP"` (explicitly excluded from `"Parallel IP"`), imposing no caching time limit or deletion requirement. Its `/v1/search` endpoint returns dense Markdown `excerpts` (configurable up to 60,000 chars total per call) plus `publish_date` (`YYYY-MM-DD`) at just **$1 per 1,000 queries** on Fast/Turbo mode ($13/month net of the $5 monthly free credit for 18,000 queries, or $85/month on Basic/Advanced), with a 600 RPM rate limit on the self-serve Build tier.
    - **Caveats:** Unlike Tavily, Parallel's structured `source_policy` object only has an `after_date` parameter; preventing the agent from seeing articles published *after* its session requires passing `before:YYYY-MM-DD` in the query string and having your daemon filter out any result whose `publish_date` is null or after the session date. Additionally, by default on the Build tier, Parallel reserves a license to use `Customer IP` (your queries and outputs) to train its own models unless you are on the Scale/Enterprise Zero Data Retention plan.
3. **#3 — Perplexity Search API (`api.perplexity.ai/search`)** *(or **Exa** if PDF terms are manually verified)*: **Strong technical fit with strict before/after date filtering, but weaker legal ownership terms.**
    - **Why it ranks third:** Perplexity's standalone `POST /search` endpoint ($1/1k on Fast Search = $18/month, or $5/1k Standard = $90/month; 50 QPS) is purpose-built for AI agents, returns configurable page text chunks via `max_tokens_per_page`, and provides explicit `search_after_date_filter`, `search_before_date_filter`, and `last_updated_before_filter` parameters to prevent future leakage. However, under the Perplexity Search Addendum (effective September 22, 2025), Schedule 1 explicitly states that *"Customer does not own, and Perplexity shall not grant it ownership of, the Search API's Output"*, and Section 2.2 ("Data Use") could not be read in full via search snippets to confirm explicit permission for indefinite archival storage. (Similarly, **Exa** at $4–$7/1k with `startPublishedDate`/`endPublishedDate` and included full `contents.text` is technically ideal, but its `Exa_Labs_Terms_of_Service.pdf` could not be read in full via search snippets.)

CONTINUE FOR PART 2

User prompt: continue

Response: The following analysis summarizes the specific sections, policy rules, and API documentation mechanics behind each requirement for the top three candidates, along with the contractual provisions that could later withdraw permission or create downstream risk.

1. Tavily (`tavily.com`)

Governing Documents & Dates: Platform Terms of Service (`[https://tavily.com/terms](https://tavily.com/terms)`, updated May 4, 2026); Help Center Policy Articles on Storing/Caching (`1612400809`), Attribution & Third-Party Rights (`4716869118`), AI Processing (`9218880805`), and Displaying/Publishing (`4025347510`), updated November 2–4, 2026.

Clause-by-Clause Breakdown of Each Pass:

- **1. Official API & AI/LLM Input (Pass):**
    - **Platform Terms §1.1 & §2:** Defines AI Tools expressly to encompass artificial intelligence models, large language models, and AI-driven software, and grants a non-exclusive license to integrate the API into Customer Applications up to the plan's call limits.
    - **Help Center (`9218880805`, AI Processing & Training Data):** Explicitly confirms that users may pass Tavily's search results to local or third-party AI models for inference-time processing, subject to the model provider's terms. The only AI-related restriction applies to Tavily's own synthesized answers, which may not be used to train or develop models that compete with Tavily.
- **2. Indefinite Storage / Caching (Pass):**

- **Help Center (`1612400809`, Storing, Caching & Retaining Output):** Explicitly confirms across dedicated Q&As that Tavily's Terms place no restrictions on storing search result metadata (URLs, titles, dates, ranks, scores), snippets, full-page extracted content (`raw_content`), or complete API responses in a user's own database long-term. It further confirms that there is no maximum retention period, no cache TTL limit, no restriction on storing derived facts, classifications, or content hashes, no restriction on replaying stored results without a new API call, and no requirement to delete already-stored outputs when a subscription ends or an account closes (sharing cached results across multiple downstream customers requires contacting support to verify plan fit).

- **3. Page Content & Length Limits (Pass):**
  - **Search API Documentation (`/search`):** Returns extracted source passages in `content`, controlled by `chunks_per_source` (1 to 3 chunks per result, targeting roughly 500 characters per chunk in `basic`/`fast` modes and 800 characters in `advanced` mode, with adjacent chunks merged). Setting `include_raw_content` to `true` (or `"markdown"` / `"text"`) returns the full parsed page text alongside each search result at no extra credit cost.
- **4. Publication Dates & Date Filtering (Pass):**
  - **Search API Documentation (`/search`):** Returns a `published_date` field per result and supports `start_date` and `end_date` parameters formatted as `YYYY-MM-DD`. Because undated pages are kept by default, Tavily provides the boolean parameter `filter_by_published_date: true`, which strictly removes any result lacking a detectable publication date or falling outside the `start_date`/`end_date` window. Cache freshness is separately tunable via `max_age_hours` (1 to 720 hours, `0` for live fetch, or `-1` for cache-only).
- **5. Price at 18,000 Queries/Month (Pass):**
  - **Pricing & Credits:** A basic `/search` request costs 1 credit even when `include_raw_content` is enabled. The free Researcher plan includes 1,000 credits/month; Pay-As-You-Go bills $0.008 per credit ($136/month for 17,000 paid credits after the 1,000 free quota), and the Bootstrap plan costs $100/month for 15,000 credits plus $24 for 3,000 overage credits ($124/month total).
- **6. No Personalization (Pass):**
  - **API Architecture & Microsoft 365 Certification Disclosure:** Requests authenticate solely via an account or organization API key (`tvly-...`), and Tavily certifies that the service performs no automated profiling or personalized ranking.
- **7. Publication of Aggregates & Short Excerpts (Pass):**
  - **Help Center (`4025347510` & `4716869118`):** Explicitly permits publishing content derived from results, citing source URLs in reports, and including short quotations or excerpts from results in published outputs. It also confirms that Tavily's Terms do not require attributing either Tavily or the original sources (though underlying publisher terms or copyright law may independently require attribution or limit quotation length).
- **8. Who May Sign Up (Pass, with minor boilerplate caveat):**
  - **Rate Limits Documentation & Platform Terms §3.1–3.2:** Rate limits documentation explicitly provisions personal accounts alongside organizations and offers a free Researcher tier. However, Platform Terms §3.2 contains standard commercial boilerplate stating that the services are provided for the customer's internal business purposes.
- **9. Rate Limits at 20/Minute Bursts (Pass):**
  - **Rate Limits Documentation:** The free Researcher tier allows 100 requests per minute (RPM), while Pay-As-You-Go and Bootstrap tiers allow 1,000 RPM, easily handling 20-request-per-minute bursts.

Provisions That Could Withdraw Permission or Create Risk:

- **Unilateral Service & Terms Modifications (Platform Terms §2, §3.3 & §4.5.8):** The license in §2 is explicitly revocable in accordance with the agreement. Under §3.3, Tavily reserves the right to alter the layout, design, or availability of specific content, features, or functions at any time without prior notice. Under §4.5.8, Tavily may modify the agreement upon notice, with continued use constituting acceptance.
- **No Third-Party Content License Pass-Through (Help Center `4716869118` & `1612400809`):** Tavily explicitly states that it grants no copyright or license rights in the underlying third-party web content returned by the API. Responsibility for complying with original publishers' terms of service and copyright law rests entirely with the user, meaning that storing full-page `raw_content` or publishing excerpts still relies on fair use or the publisher's own terms rather than a sublicense from Tavily.
- **Internal Business Purposes Phrasing (Platform Terms §3.2):** Although Tavily's self-serve portal and documentation explicitly accommodate personal accounts and a free Researcher tier, the formal legal text in §3.2 frames permitted usage around internal business purposes.

2. Parallel (`parallel.ai`)

Governing Documents & Dates: Customer Terms and Conditions (`[https://parallel.ai/customer-terms](https://parallel.ai/customer-terms)`, updated August 11, 2026 / October 17, 2026) and Website Terms of Service (`[https://parallel.ai/terms-of-service](https://parallel.ai/terms-of-service)`, August 11, 2026).

Clause-by-Clause Breakdown of Each Pass:

- **1. Official API & AI/LLM Input (Pass):**
  - **Customer Terms §1(b)–(c), §1(h) & §5(a):** Defines `Services` to cover the Parallel APIs and Parallel Processors, `Customer Input` as queries and data submitted by authorized users, and `Customer Output` as the responses generated and returned by the Services. The API is purpose-built for AI agent grounding. The only AI-specific restriction in §5(a) prohibits using the Services or Customer Outputs to make automated decisions without human oversight that materially harm individual rights in regulated high-risk domains (employment, healthcare, finance, legal, housing, insurance, or social benefits)—which a non-trading paper portfolio research project does not trigger.
- **2. Indefinite Storage / Caching (Pass):**
  - **Customer Terms §1(c), §1(e), §1(i) & §4(a)–(b):** Defines `Customer IP` as comprising both `Customer Inputs` and `Customer Outputs`, and expressly excludes `Customer IP` from `Parallel IP`. Customer Terms §4 grants the customer broad rights to modify, adapt, and build derivative works from `Customer Output`, with no caching TTL, retention limit, or post-termination deletion mandate on `Customer Output`.
- **3. Page Content & Length Limits (Pass):**
  - **Search & Extract API Documentation (`/v1/search` & `/v1/extract`):** `/v1/search` returns dense extracted Markdown passages in an `excerpts` array, sized via `excerpts.max_chars_per_result` (default 30,000 characters; configurable from 1,000 to 100,000 characters) and `excerpts.max_chars_total` (default 100,000 characters; configurable up to 1,000,000 characters). `/v1/extract` also supports `full_content` extraction (e.g., 50,000 characters per result).
- **4. Publication Dates & Date Filtering (Partial / Pass with Query Operator):**
  - **Search API Documentation & Changelog (Dec 16, 2025):** Each result includes a `publish_date` field (`YYYY-MM-DD`), and `source_policy.after_date` filters results to pages published on or after an RFC 3339 date string (`YYYY-MM-DD`). However, `source_policy` lacks a structured `before_date` field, so enforcing an upper date bound requires passing `before:YYYY-MM-DD` in the search query and having your daemon verify `publish_date` before passing results to the model.
- **5. Price at 18,000 Queries/Month (Pass):**
  - **Pricing & Changelog (Aug 19, 2026):** New accounts receive up to $80 in onboarding credits plus a recurring $5/month free credit. `/v1/search` with excerpts included costs $1 per 1,000 requests in `fast` mode ($18/month gross, or $13/month net of the $5 credit) or $5 per 1,000 requests in `basic`/`advanced` mode ($90/month gross, $85/month net).
- **6. No Personalization (Pass):**
  - **API Documentation:** Requests are stateless and unpersonalized; geographic localization occurs only if an ISO country code is explicitly passed in the `location` parameter.
- **7. Publication of Aggregates & Short Excerpts (Pass):**
  - **Customer Terms §1(e) & §4(b):** Because `Customer Output` is treated as `Customer IP` and the customer is explicitly permitted to modify, adapt, create derivative works from, and incorporate `Customer Output` into other materials, publishing aggregate performance statistics and short excerpts is contractually permitted without mandatory Parallel attribution.
- **8. Who May Sign Up (Pass):**
  - **Customer Platform & Terms:** Self-serve Launch (free) and Build (pay-as-you-go credit card) plans are open to individual developers without requiring an enterprise contract.
- **9. Rate Limits at 20/Minute Bursts (Pass):**
  - **Rate Limits Documentation (`/getting-started/rate-limits`):** The default quota for `POST /v1/search` and `POST /v1/extract` on the Build plan is 600 requests per minute (10 QPS), which is 30 times the required 20/minute burst rate.

Provisions That Could Withdraw Permission or Create Risk:

- **Customer Responsibility for Third-Party Content Rights (Customer Terms §5(a)):** Under §5(a), the customer assumes sole liability for all uses of `Customer Outputs`. While Parallel classifies `Customer Output` as `Customer IP` as between Parallel and the customer, Parallel cannot transfer underlying third-party publisher copyrights, leaving the user responsible for ensuring that downstream excerpt publication complies with copyright law.
- **Model Training on Customer IP by Default (Customer Terms §4(b)):** On self-serve plans, §4(b) grants Parallel a license to use `Customer IP` (both queries and returned outputs) to train and improve Parallel's machine learning models (de-linked from individuals), unless the customer upgrades to an enterprise Zero Data Retention agreement. While this does not restrict your agent's use of the API, it means your queries are visible to Parallel's training pipeline.

- **Periodic Updates to Customer Terms:** Parallel updated its Customer Terms multiple times in 2026 (including July 1, August 11, and October 17, 2026), meaning self-serve users are subject to periodic policy revisions.

3. Perplexity Search API (`api.perplexity.ai/search`)

Governing Documents & Dates: Perplexity API Terms of Service (https://www.perplexity.ai/hub/legal/perplexity-api-terms-of-service, updated January 23, 2026), Perplexity Search Addendum (https://www.perplexity.ai/hub/legal/perplexity-api-terms-of-service-search, updated September 22, 2025), and General Terms of Service (https://www.perplexity.ai/hub/legal/terms-of-service, January 23, 2026).

Clause-by-Clause Breakdown of Each Requirement:

- **1. Official API & AI/LLM Input (Pass):**
  - **API Terms §1.4 & Search Addendum §1.1.5–1.1.6, §1.2.2:** Expressly authorizes integrating the Search Services into `Customer Applications`, defining `Input` as queries submitted by the customer's application and `Output` as the responses returned by the Search Service. Search Addendum §1.2.2 clarifies that the raw `/search` API is legally separate from the Sonar LLM APIs, and the API documentation explicitly frames `/search` as a tool for AI agents.
- **2. Indefinite Storage / Caching (Unclear — Full Section 2.2 Not Readable, Ownership Disclaimed):**
  - **Search Addendum §4 & Schedule 1:** While the Search Addendum snippet confirms that §2.1, §2.2 ("Data Use"), §3, and §4 survive termination or expiration of the Addendum, the full body of §2.2 could not be read via search snippets to verify whether it imposes a caching TTL. Furthermore, Schedule 1 explicitly states that `/search` Output comes from the public internet and that Perplexity neither recognizes nor grants customer ownership over the Search API's Output. Under the project's rule that silence or unread text is not permission, this requirement remains **Unclear** until §2.2 is inspected directly in a browser.
- **3. Page Content & Length Limits (Pass):**
  - **Search API Documentation (`/docs/search/overview` & `/quickstart`):** `POST /search` returns extracted webpage text inside each result's `snippet` field rather than just a short meta description. Extraction depth is controlled via `max_tokens_per_page` (capping tokens extracted per URL) and `max_tokens` (capping total webpage tokens returned across all results, up to 1,000,000 tokens).
- **4. Publication Dates & Date Filtering (Pass):**
  - **Date and Time Filters Documentation (`/docs/search/filters/date-time-filters`):** Returns publication and modification dates and supports both lower-bound and upper-bound filters: `search_after_date_filter` and `search_before_date_filter` (strictly filtering by original publication date in `MM/DD/YYYY` format), plus `last_updated_after_filter` and `last_updated_before_filter` (filtering by page modification date). Setting both `search_before_date_filter` and `last_updated_before_filter` to the session date prevents future information leakage.
- **5. Price at 18,000 Queries/Month (Pass):**
  - **Search API Pricing:** There is no free tier. Standard `/search` costs $5 per 1,000 requests ($90/month for 18,000 queries), and Fast Search (`search_type: "fast"`) costs $1 per 1,000 requests ($18/month for 18,000 queries), with no extra charge for tokens extracted via `max_tokens_per_page`.
- **6. No Personalization (Pass):**
  - **Search API Documentation:** Calls are stateless and unpersonalized; location filtering occurs only when `country`, `city`, or `region` parameters are explicitly supplied.
- **7. Publication of Aggregates & Short Excerpts (Unclear):**
  - **General Terms §1.1.2 & Search Addendum Schedule 1:** General Terms §1.1.2 prohibits publishing Output generated by Perplexity's services without clearly citing Perplexity, while Search Addendum Schedule 1 states that the customer does not own Search API Output. Because Search Addendum §2.2 could not be read in full to verify excerpt redistribution rights, this remains **Unclear**.
- **8. Who May Sign Up (Unclear — B2B Framing):**
  - **Search Addendum Preamble & §1.1.4:** Although any individual with a credit card can create an API account in the self-serve portal, the Search Addendum preamble frames the contract as an agreement with the organization (`"Customer"`) on whose behalf the user accesses the API, and defines `"Authorized Users"` as the Customer's personnel.
- **9. Rate Limits at 20/Minute Bursts (Pass):**
  - **Search API Documentation:** Default rate limits provide 50 query units per second (3,000 requests per minute), well above the 20/minute burst requirement.

Provisions That Could Withdraw Permission or Create Risk:

- **Unilateral Amendment via Platform Pop-Up (Search Addendum §1.2.3):** Perplexity explicitly reserves the right to modify the Search Addendum at any time—including via a simple pop-up notice inside the API platform—with continued access or use of the Search Services automatically binding the customer to the revised terms, overriding any contrary amendment rules in the base API Agreement.
- **No Ownership or IP Indemnification on Search Output (Search Addendum Schedule 1):** Schedule 1 explicitly states that because Search API Output is sourced from the public internet, the customer receives no ownership rights in the Output, and any intellectual property indemnification or assurances provided by Perplexity in the base Agreement are entirely disclaimed for `/search` Output.
